Combos

Combos allow you to add custom actions when a certain combination of keys is pressed. for example, hitting **A** and **S** within the combo term would hit **ESC** instead, or have it perform even more complex tasks.

1. Combos

Click the **Combos** tab at the top and one of the available numbers below it. By default, 8 combos can be configured. This number can be adjusted in firmware at compile (Not GUI) see [here](#) for more info.

The settings for that particular combo will be shown. Up to 4 combination of keys can be configured to activate 1 action. Each key must be pressed within the combo term to be considered a combo. In the case below, pressing the **+/=** key and the **backspace** key will instead trigger the delete key.

2. Using a Combo

After the combo has been configured and saved, it can be used. There is no need to assign it to a specific key.

More info

Combos is a QMK feature and more detailed information can be found with the [official QMK documentation](#).
